

Q Exploration Log

Project: NovaTech Revenue Intelligence Dashboard

Date: September 11, 2026

Analyst: Ayomide Ayodele

Domain 1: Marketing Campaign Performance

Entry 1: Which campaign channel generates the most leads?

Question Asked: "What is the total lead count by campaign channel?"

Answer Returned: Partner Referral leads with 20,403 records, followed by Organic Search at 16,550 and Email at 13,961. Paid Social came in at 11,912, while Direct Mail trailed at just 2,622.

Accuracy Assessment: Accurate. These numbers match the horizontal bar chart on the Marketing Campaign Performance sheet. The total across all channels adds up to 65,448, which is consistent with the donut chart showing total leads.

Business Value: Partner Referral clearly drives the most volume into the funnel. But volume alone does not tell the full story. When you pair this with ROI data, Partner Referral spent \$181M to generate those leads at a negative 92.4% return. Direct Mail, despite having the fewest leads, actually delivers the best cost efficiency at negative 69.4% ROI. This suggests the team should consider shifting budget toward Direct Mail and testing whether Partner Referral can be optimized for cost.

Entry 2: What is the ROI for each campaign?

Question Asked: "Show me Campaign ROI by campaign name."

Answer Returned: All six campaigns are in negative territory. Enterprise Expansion sits at roughly negative 90%, Digital Retarget at negative 91%, Year-End Accelerator and NovaPulse Launch both around negative 92%, NovaEdge Awareness at negative 99.6%, and Q3 Growth Sprint performing worst overall.

Accuracy Assessment: Accurate. The horizontal bar chart on the Marketing sheet confirms every campaign is deep in the red. The ranking and relative scale match what Q returned.

Business Value: A negative 92.9% overall ROI on \$364.9M in total spend is the single most alarming finding in this entire dataset. Either the campaigns are genuinely failing to convert, or the attribution model is not capturing downstream revenue properly. Both possibilities need urgent investigation. At minimum, NovaEdge Awareness should be paused immediately given its near-total loss.

Domain 2: Sales Pipeline and Deals

Entry 3: How is deal value distributed across sales regions?

Question Asked: "What is the total deal value by sales region?"

Answer Returned: West leads at \$42,670,845, Central follows at \$38,704,048, and East trails at \$19,525,789.

Accuracy Assessment: Accurate. These figures match the horizontal bar chart on the Sales Pipeline sheet and the KPI total of \$100.9M. The three regions add up correctly.

Business Value: The East region is generating less than half the deal value of the West. That kind of gap does not happen by accident. It could be a headcount issue, a territory coverage problem, or a market maturity difference. Whatever the cause, the sales leadership team needs to dig into the East region specifically and figure out whether additional reps, better enablement, or a revised territory strategy could close the gap.

Entry 4: What is the discount rate difference between products?

Question Asked: "Compare list price versus deal value by product category."

Answer Returned: NovaPulse accounts for \$80.6M in deal value with a 29.1% average discount off list price. NovaEdge contributes \$20.3M but at a 54.6% average discount, nearly double what NovaPulse carries.

Accuracy Assessment: Accurate. The clustered bar chart comparing list price to deal value on the Sales sheet clearly shows the gap between the two products. The discount percentages are consistent with the visual.

Business Value: Discounting NovaEdge at 54.6% is not sustainable. It eats into margins and sends a signal to the market that the product is not worth its list price. If reps are consistently discounting this heavily to close deals, it points to either a pricing problem, a competitive positioning weakness, or both. Sales leadership should set discount guardrails for NovaEdge and work with product marketing to reassess its value proposition.

Domain 3: Customer Support and Product Health

Entry 5: Which product areas generate the most support tickets?

Question Asked: "Show me support ticket count by product area."

Answer Returned: Notifications leads with 567 tickets, followed closely by Analytics Dashboard at 561. Together they account for 1,128 tickets out of 2,792 total.

Accuracy Assessment: Accurate. The horizontal bar chart on the Customer Support sheet confirms these two modules sit well above every other product area. The combined 1,128 represents 40.4% of all tickets, which matches the annotation on the dashboard.

Business Value: When two modules are responsible for over 40% of all support volume, that is not a random distribution. It is a concentrated product quality problem. These modules are creating friction for customers on a daily basis, and that friction translates directly into dissatisfaction and potential churn. Engineering should treat Notifications and Analytics Dashboard as priority fixes, not routine maintenance items.

Entry 6: What does customer sentiment look like across tickets?

Question Asked: "What is the breakdown of tickets by customer sentiment?"

Answer Returned: Neutral accounts for 1,821 tickets (65.2%), Negative represents 630 tickets (22.6%), and Positive makes up 341 tickets (12.2%).

Accuracy Assessment: Accurate. The donut chart on the Customer Support sheet confirms this distribution. The three categories total 2,792, matching the overall ticket count.

Business Value: Nearly one in four tickets carries negative sentiment. That is a retention warning sign. Customers who take the time to express frustration through a support ticket are telling you they are unhappy. If those tickets are not triaged and resolved quickly, those customers become churn risks. A dedicated process for flagging and escalating negative-sentiment tickets would help the support team catch problems before they turn into lost accounts.

Entry 7: Cross-Dataset Question: How do marketing leads connect to support issues?

Question Asked: "What is the relationship between campaign leads and support ticket volume by account?"

Answer Returned: The unified dataset shows that accounts generating the highest lead volume also tend to have elevated support ticket counts. Large and Enterprise accounts, which represent 78.8% of the account base, contribute disproportionately to both lead generation and support demand.

Accuracy Assessment: Partially accurate. Q provided a directional answer, but the exact correlation requires deeper analysis. The dashboard confirms that Large and Enterprise accounts dominate both the lead funnel and the support queue, which supports Q's response.

Business Value: This is an important cross-functional insight. The accounts that marketing is investing the most in acquiring are also the ones generating the most support friction. If those accounts have a poor support experience after being brought in through expensive campaigns, the company is essentially paying to acquire customers it then frustrates. Aligning marketing acquisition targets with product readiness and support capacity would help ensure that new accounts have a positive experience from day one.
