

Executive Report: NovaTech Revenue Intelligence Dashboard

Prepared for: VP Sarah Chen

Date: September 11, 2026

Prepared by: Ayomide Ayodele, Data Analytics Team

Executive Summary

This report presents the findings from the NovaTech Revenue Intelligence Dashboard, a unified analytics platform built to consolidate data from three previously siloed business systems: CRM deals, marketing campaigns, and customer support tickets. The dashboard enables Sarah Chen's team to identify revenue trends, flag at-risk accounts, and make faster, more informed decisions across the revenue operations function.

The analysis covers 85 active accounts, 65,448 marketing leads, a \$100.9M deal pipeline, and 2,792 support tickets. Four critical themes emerged: a marketing ROI crisis requiring immediate attribution review, a product pricing imbalance eroding NovaEdge margins, concentrated support friction in two product modules, and significant revenue concentration risk across both industry and company size dimensions.

Data Strategy

The dashboard draws from three CSV source files, each representing a different business system:

The first is the CRM deals file, which contains sales opportunity records including deal values, sales rep assignments, product categories, and regional breakdowns. The second is the marketing campaigns file, which captures lead generation activity across six campaigns and five channels, along with spend and attributed revenue. The third is the support tickets file, which logs customer support interactions with priority levels, product areas, sentiment classifications, and resolution timelines.

All three datasets were imported into SPICE (QuickSight's in-memory engine) to enable fast query performance. The CRM deals table was used as the anchor table because it connects most directly to revenue outcomes. The three tables were joined using a left join on the shared `account_id` field, which serves as the common key across all three systems. This approach preserves all deal records while enriching them with marketing and support context where available.

Data type corrections were applied during preparation. Date fields such as `ticket_created_date` and `campaign_date` were converted from string format to proper date types to enable time-based analysis. Four calculated fields were created to support deeper analysis: Campaign ROI (measuring return on marketing spend), Ticket Resolution Days (calculating the time between ticket creation and resolution), Company Size (categorizing accounts by employee count), and Engagement Gap (measuring days since last customer engagement).

Dashboard Design Rationale

The dashboard was organized into four sheets, each addressing a distinct business question that Sarah Chen's team faces regularly.

The Marketing Campaign Performance sheet was designed to answer the question: "Are our campaigns generating a positive return?" It includes a KPI card comparing total spend against attributed revenue, a funnel chart showing lead conversion stages, campaign ROI by name, and lead distribution by customer segment. These visuals work together to show both the volume and quality of marketing activity.

The Sales Pipeline and Deals sheet addresses: "Where is our revenue coming from, and are we pricing effectively?" It features deal value breakdowns by sales rep, region, and product category, along with a comparison of list price versus actual deal value to surface discounting patterns.

The Customer Support and Health sheet answers: "Which product areas are causing the most friction?" It displays ticket volume by priority, product area, sentiment, and contact channel, helping the team identify where engineering resources should be focused.

The Customer Account 360 sheet tackles: "How concentrated is our revenue, and where are we vulnerable?" It shows revenue by industry, account distribution by company size, and engagement patterns by customer tier.

Interactive filter controls were added to three sheets, allowing viewers to slice data by campaign name, sales region, product category, and other dimensions. A cross-sheet navigation action was configured so that clicking a campaign on the Marketing sheet takes the viewer directly to the Sales Pipeline sheet, enabling seamless exploration across business domains. A one-click filter action on the Sales sheet allows viewers to click a region and instantly filter all other visuals on the same sheet.

Topic Configuration and Q Accuracy

Before configuring a Topic, baseline questions were tested in Quick Chat to establish a starting point for Q's accuracy. Questions like "What is the total deal value by sales region?" and "What is the total campaign spend?" returned reasonable answers, but Q occasionally lacked context about field meanings and relationships between datasets.

A Topic named "NovaTech Revenue Intelligence" was then created, incorporating all three source datasets. Field descriptions were added to key columns to help Q understand business context. For example, `deal_value` was described as "Dollar value of a sales deal," `campaign_spend` as "Total dollars spent on a marketing campaign," and `ticket_id` as "Unique identifier for a support ticket."

After Topic configuration, the same baseline questions were re-tested. Q's responses showed improved precision and consistency. The total deal value by region question returned the same accurate figures, but with clearer formatting and source attribution. The campaign spend question correctly identified the \$364.9M total and referenced the marketing dataset specifically. Overall, Topic configuration improved Q's ability to interpret business intent and return contextually appropriate answers.

Key Insights and Recommended Actions

1. Marketing Campaign ROI Crisis

All six campaigns are operating at a loss, with an overall ROI of negative 92.9%. Total spend of \$364.9M generated only \$26.1M in attributed revenue. The NovaEdge Awareness campaign is the worst performer at negative 99.6% ROI, while Direct Mail shows the strongest relative return at negative 69.4%.

Recommended Action: Audit the marketing attribution model to determine whether downstream conversions are being undercounted. Reallocate budget toward Direct Mail and pause NovaEdge Awareness until the campaign is repositioned.

2. NovaEdge Pricing and Discount Erosion

NovaPulse drives 79.8% of total deal value (\$80.6M), while NovaEdge contributes \$20.3M at a steep 54.6% average discount, nearly double the 29.1% discount on NovaPulse. This level of discounting is unsustainable and erodes margins.

Recommended Action: Conduct a pricing review for NovaEdge. Establish discount thresholds and evaluate whether the product needs repositioning against competitors.

3. Support Friction in Two Product Modules

Notifications and Analytics Dashboard together generate 40.4% of all 2,792 support tickets. Negative customer sentiment accounts for 22.6% of tickets, suggesting these issues are actively hurting satisfaction and potentially driving churn.

Recommended Action: Engineering should prioritize fixes in Notifications and Analytics Dashboard. Implement a dedicated triage process for negative-sentiment tickets to catch at-risk accounts early.

4. Revenue Concentration Risk

Software (\$79.8M) and Technology (\$45.2M) industries dominate revenue. Large and Enterprise accounts represent 78.8% of the 85-account base. This creates significant exposure if either segment contracts or a major account churns.

Recommended Action: Develop a Small and Mid-Market growth strategy to diversify the customer base. Build industry-specific retention programs for Software and Technology accounts.

5. East Region Underperformance

The East region generates just \$19.5M in deal value, less than half of the West region's \$42.7M. This gap suggests potential issues with territory coverage, rep capacity, or market penetration.

Recommended Action: Investigate root causes of East region underperformance. Consider targeted sales enablement and additional headcount allocation.

AI Analysis vs. Dashboard Comparison

Throughout this project, Quick Chat (Q) was used alongside the dashboard to explore the data. In most cases, Q's answers aligned closely with the dashboard visuals. For example, Q correctly identified the total deal value of \$100.9M, the three sales regions and their respective values, and the total ticket count of 2,792. These figures matched the KPI cards and charts on the dashboard exactly.

There were a few areas where the dashboard provided richer context than Q alone. The funnel chart on the Marketing sheet visually highlighted the conversion bottleneck between Qualified Lead and Opportunity stages in a way that was immediately intuitive, while Q's text-based response required more interpretation. Similarly, the clustered bar chart comparing list price to deal value made the NovaEdge discount problem visually obvious, whereas Q returned the raw numbers without the comparative framing.

On the other hand, Q was particularly useful for quick, targeted questions that would have required navigating multiple sheets on the dashboard. Asking "What is the total deal value by sales region?" returned an instant, accurate table without needing to find the right sheet and visual.

The takeaway is that Q and the dashboard serve complementary roles. Q excels at fast, specific lookups and ad-hoc exploration. The dashboard excels at visual pattern recognition, trend identification, and presenting multiple metrics in context. For Sarah Chen's team, the most effective workflow would be to use the dashboard for regular performance reviews and Q for on-the-fly questions during meetings or decision-making moments.

Summary of Recommended Actions

1. Audit marketing attribution model and reallocate budget toward Direct Mail
2. Pause NovaEdge Awareness campaign and redesign targeting
3. Review NovaEdge pricing strategy to address 54.6% discount rate
4. Deploy sales enablement resources in the East region
5. Prioritize engineering fixes for Notifications and Analytics Dashboard modules

6. Implement triage process for negative-sentiment support tickets
7. Build Small and Mid-Market acquisition strategy
8. Create retention programs for Software and Technology verticals
