

Executive Report: NovaTech Revenue Intelligence Dashboard

Prepared for: VP Sarah Chen

Date: September 11, 2026

Prepared by: Ayomide Ayodele, Data Analytics Team

Executive Summary

This report presents findings from the NovaTech Revenue Intelligence Dashboard, a unified analytics platform that consolidates data from three business systems into a single view. The analysis covers 85 active accounts, 65,448 marketing leads, a \$100.9M deal pipeline, and 2,792 support tickets. Four critical themes emerged: a marketing ROI (Return on Investment, the percentage of revenue gained or lost relative to spend) crisis, a product pricing imbalance, concentrated support friction, and revenue concentration risk.

Data Strategy

Three CSV source files were imported into SPICE (Super-fast, Parallel, In-memory Calculation Engine), which is QuickSight's high-speed data storage layer that enables fast dashboard performance. The three sources are: CRM deals (sales opportunities with deal values, reps, and regions), marketing campaigns (lead generation activity with spend and attributed revenue), and support tickets (customer interactions with priority, sentiment, and product area).

The CRM deals table was used as the anchor table because it connects most directly to revenue. All three tables were joined using a left join on the shared `account_id` field, preserving all deal records while enriching them with marketing and support context. Four calculated fields were created: Campaign ROI (return on marketing spend), Ticket Resolution Days (time between ticket creation and resolution), Company Size (account categorization by employee count), and Engagement Gap (days since last customer interaction).

Dashboard Design Rationale

The dashboard contains four sheets, each addressing a specific business question. The Marketing Campaign Performance sheet answers whether campaigns generate positive returns, using a KPI (Key Performance Indicator, a summary metric showing business performance at a glance) card, funnel chart, and ROI breakdown. The Sales Pipeline and Deals sheet examines revenue sources and pricing effectiveness through deal value comparisons by rep, region, and product. The Customer Support and Health sheet identifies product friction points using ticket volume, sentiment, and resolution analysis. The Customer Account 360 sheet assesses revenue concentration across industries and company sizes.

Interactive filter controls were added to multiple sheets, allowing viewers to slice data by dimensions like sales region, product category, and priority. A cross-sheet navigation action lets users click a campaign on the Marketing sheet to jump directly to the Sales Pipeline sheet. A one-click filter action on the Sales sheet filters all visuals when a user clicks a specific region.

How Topic Configuration Affected Q Accuracy

A Topic (a curated data layer that helps QuickSight's AI assistant understand business context) was configured with all three datasets and field descriptions for key columns. Before the Topic was created, Q returned basic answers but sometimes lacked context about what fields meant or how datasets related to each other. After configuration, Q's responses improved in precision and source attribution. For example, the question "What is the total deal value by sales region?" returned clearer formatting and explicitly referenced the Sales Pipeline data. The Topic helped Q interpret business intent rather than just matching keywords.

Key Insights and Recommended Actions

All six marketing campaigns are operating at a loss, with an overall ROI of negative 92.9%. Total spend of \$364.9M generated only \$26.1M in attributed revenue. NovaEdge Awareness is the worst performer at negative 99.6%, while Direct Mail shows the strongest relative return at negative 69.4%. The attribution model should be audited, and NovaEdge Awareness should be paused until repositioned.

NovaPulse drives 79.8% of deal value (\$80.6M), while NovaEdge contributes \$20.3M at a 54.6% average discount, nearly double NovaPulse's 29.1%. This erodes margins and signals a pricing problem. Sales leadership should establish discount thresholds and review NovaEdge's competitive positioning.

Notifications and Analytics Dashboard modules generate 40.4% of all 2,792 support tickets. Negative sentiment accounts for 22.6% of tickets, indicating active customer dissatisfaction. Engineering should prioritize fixes in these two modules and implement a triage process for negative-sentiment tickets.

Software (\$79.8M) and Technology (\$45.2M) dominate revenue, while Large and Enterprise accounts represent 78.8% of the 85-account base. This concentration creates risk if either segment contracts. A Small and Mid-Market growth strategy should be developed alongside industry diversification efforts.

AI Analysis vs. Dashboard Comparison

Q and the dashboard produced consistent results for factual queries. Total deal value (\$100.9M), regional breakdowns (West \$42.7M, Central \$38.7M, East \$19.5M), and ticket counts (2,792) matched exactly between Q's responses and dashboard KPIs.

The dashboard provided richer context in some areas. The funnel chart made the conversion bottleneck between Qualified Lead and Opportunity stages visually obvious, while Q's text response required more interpretation. The clustered bar chart comparing list price to deal value made the NovaEdge discount problem immediately visible in a way that raw numbers alone did not convey.

Q excelled at fast, targeted lookups. Asking "What is the total deal value by sales region?" returned an instant table without navigating multiple sheets. For Sarah Chen's team, the most effective approach is to use the dashboard for regular performance reviews and pattern recognition, and Q for quick answers during meetings or ad-hoc decision moments.
